Sink Current Capability up to 100mA

### General Description

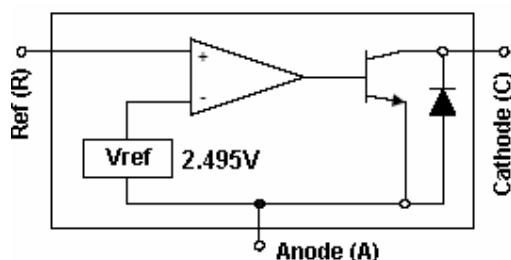

The TS431/431A/431B integrated circuits are three-terminal programmable shunt regulator diodes. These monolithic IC voltage references operate as a low temperature coefficient zener which is programmable from Vref to 36 volts with two external resistors. These devices exhibit a wide operating current range of 1.0 to 100mA with a typical dynamic impedance of 0.22Ω. The characteristics of these references make them excellent replacements for zener diodes in many applications such as digital voltmeters, power supplies, and op amp circuitry. The 2.5volt reference makes it convenient to obtain a stable reference from 5.0volt logic supplies, and since The TS431/431A/431B operates as a shunt regulator, it can be used as either a positive or negative stage reference.

This series is offered in 3-pin TO-92, SOT-89, SOT-23 and SOP-8 package.

### Electrical Characteristics (continued) ( $T_a=25^\circ\text{C}$ , unless otherwise specified.)

Note 4. Deviation of reference input voltage,  $V_{DEV}$ , is defined as the maximum deviation of the reference over the full temperature range.

The average temperature coefficient of the reference input voltage  $\alpha V_{ref}$  is defined as:

$$|\alpha V_{ref}| = [V_{DEV} / V_{ref}(25^\circ\text{C})] * 10^6 / T_2 - T_1 \quad (\text{PPM}/^\circ\text{C})$$

Where:  $T_2-T_1$  = full temperature change.

$\alpha V_{ref}$  can be positive or negative depending on whether the slope is positive or negative.

Example: Maximum  $V_{ref}=2.496\text{V}$  at  $30^\circ\text{C}$ , minimum  $V_{ref}=2.492\text{V}$  at  $0^\circ\text{C}$ ,  $V_{ref}=2.495\text{V}$  at  $25^\circ\text{C}$ ,  $\Delta T=70^\circ\text{C}$

$$|\alpha V_{ref}| = [4\text{mV} / 2495\text{mV}] * 10^6 / 70^\circ\text{C} \approx 23\text{ppm}/^\circ\text{C}$$

Note 5. The dynamic output impedance,  $R_z$ , is defined as:

$$|Z_{ka}| = \Delta V_{ka} / \Delta I_{ka}$$

When the device is programmed with two external resistors  $R_1$  and  $R_2$  (see Figure 2). The dynamic output impedance of the overall circuit, is defined as :

$$|Z_{ka}| = \Delta V / \Delta I \approx Z_{ka} | * (1 + R_1 / R_2)$$

### Test Circuits

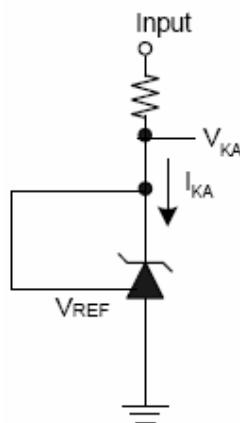

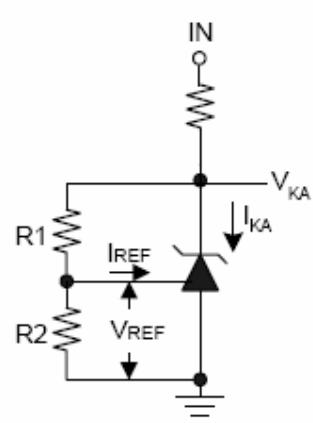

Figure 1.  $V_{KA} = V_{ref}$

$$V_{ka} = V_{ref}(1+R_1/R_2) + I_{ref} * R_1$$

test circuit for voltage amplification

test circuit for reference impedance

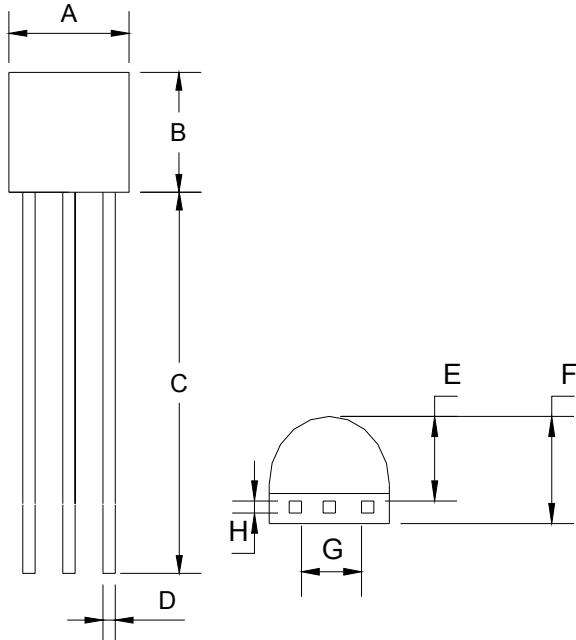

test circuit for curve A

test circuit for curve B, C, D

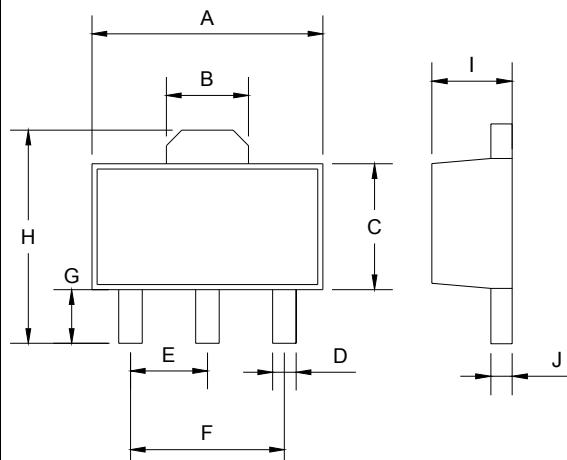

the area under the curves represent conditions that may cause the device to oscillate. for curves B, C and D, R2 and V+ were adjusted to establish the initial V<sub>ka</sub> and I<sub>ka</sub> conditions with CL=0. V<sub>batt</sub> and CL were then adjusted to determine the ranges of stability.
